

The map shows a section of a city grid. A green line representing the Central Arizona Project canal runs diagonally from the top left towards the bottom right. A red line segment is drawn along this canal, extending from the intersection of Cactus Road and the canal towards the bottom right. The area to the right of the canal is shaded with a stippled pattern and labeled "Cactus Road and CAP Canal". A large black number "4" is placed in the center of the map. Various street names are labeled: Sutton, Jenan, Gary, Cholla, Mercer, Kalil, Gail, and Via Linda. The map also shows several residential blocks with street names like 100th, 101st, 102nd, 104th, 106th, 108th, 109th, 110th, 115th, and 120th.

This fissure trace was identified by Ralph Weeks and Mike Rucker of AMEC Earth and Environmental in 2002. It is significant because of its proximity to the CAP canal. Its location has been accurately mapped by ADWR and its surface expression has changed little between the time it was identified and today, even though numerous heavy rainfall events have occurred during that time period.
